Halter Hiring Team
Halter
Auckland, New Zealand

Dear Halter Hiring Team,

I am writing to apply for the Software Engineering Internship 2026 at Halter, with a primary interest in the Platform Engineering team and a secondary interest in Backend Engineering. I am especially drawn to the Platform Engineering scope described in the role, including internal infrastructure, data ingestion, AWS/Terraform, CI/CD, observability, and tooling that helps engineers move faster. I am currently based in Auckland and completing a Master of Software Engineering, expected to graduate in April 2027. I am available for the onsite full-time internship period from mid-to-late November 2026 through February 2027.

What attracts me most to Halter is the real-world nature of its engineering problems. I am especially interested in systems that must operate reliably across cloud infrastructure, data pipelines, hardware, and live farm environments, where backend and platform engineering have direct customer impact.

I bring 4+ years of professional software engineering experience, including 4 years at Huawei and a backend internship at OKX. At Huawei, I worked on backend services for cluster network management systems, including Spring Boot-based microservices deployed on Kubernetes, cross-service communication using Thrift IDL, distributed service debugging, tracing, and production-oriented troubleshooting. At OKX, I gained exposure to event-driven architecture and high-performance backend systems in a core matching system team.

Alongside my backend experience, I have been strengthening my platform engineering skill set across AWS, Azure, Kubernetes, Terraform, CI/CD, GitHub Actions, Argo CD, Argo Rollouts, and cloud governance, supported by certifications including AWS Certified Solutions Architect – Professional, Microsoft Certified: Azure Solutions Architect Expert, and CKAD. My current project, Cloud Governance X, focuses on cloud resource inventory, cost visibility, ETL tracking, PostgreSQL persistence, Azure Resource Graph, Azure Cost Management, GitHub Actions CI, and Terraform-based infrastructure scaffolding.

I would be excited to join Halter as an intern and hold myself to a high engineering standard: taking ownership, learning quickly, communicating clearly, and contributing to reliable backend systems, infrastructure automation, and internal tooling that help teams move faster.

Kind regards,
Weilai Wang
